// unmatched right part point (fr[i] == -1)
        Flow Models
· Maximum/Minimum flow with lower bound / Circulation problem
  1. Construct super source S and sink T.
  2. For each edge (x,y,l,u), connect x\to y with capacity u-l.
3. For each vertex v, denote by in(v) the difference between the sum of
     incoming lower bounds and the sum of outgoing lower bounds.
  4. If in(v)>0, connect S\to v with capacity in(v), otherwise, connect
     v \rightarrow T with capacity -in(v).
     – To maximize, connect t \to s with capacity \infty (skip this in circulation problem), and let f be the maximum flow from S to T. If f \neq \sum_{v \in V, in(v) > 0} in(v), there's no solution. Otherwise, the maximum
        mum flow from s to t is the answer. Also, f is a mincost valid flow.
     – To minimize, let f be the maximum flow from S to T. Connect t \to s with capacity \infty and let the flow from S to T be f'. If f+f' \neq \sum_{v \in V, in(v) > 0} in(v), there's no solution. Otherwise, f' is the answer.
  5. The solution of each edge e is l_e+f_e, where f_e corresponds to the flow
· Construct minimum vertex cover from maximum matching M on bipartite
```

(0, -d(v))

```
6. Flow from S to T, the answer is the cost of the flow C+K
  Maximum density induced subgraph
   1. Binary search on answer, suppose we're checking answer {\cal T}
   2. Construct a max flow model, let K be the sum of all weights
   3. Connect source s \to v, v \in G with capacity K
   4. For each edge (u, v, w) in G, connect u \to v and v \to u with capacity w
   5. For v \in G, connect it with sink v \to t with capacity K+2T
        \left(\sum_{e \in E(v)} w(e)\right) - 2w(v)
   6. \stackrel{.}{T} is a valid answer if the maximum flow f < K|V|
  Minimum weight edge cover
   1. For each v \, \in \, V create a copy v'\text{, and connect }u' \, \to \, v' with weight
        w(u,v).
   2. Connect v \to v' with weight 2\mu(v), where \mu(v) is the cost of the cheap-
        est edge incident to \boldsymbol{v}.
   3. Find the minimum weight perfect matching on G'

Misc 8 Theorems

Spherical Coordinate

$$x = r \sin \theta \cos \phi$$
$$y = r \sin \theta \sin \phi$$
$$z = r \cos \theta$$

 $r = \sqrt{x^2 + y^2 + z^2}$ $\theta = a\cos(z/\sqrt{x^2 + y^2 + z^2})$ $\phi = \mathsf{atan2}(y,x)$

Spherical Cap

· A portion of a sphere cut off by a plane.

- r: sphere radius, a: radius of the base of the cap, h: height of the cap, θ :
- Volume = $\pi h^2 (3r h)/3 = \pi h (3a^2 + h^2)/6 = \pi r^3 (2 + \cos \theta) (1 \cos \theta)^2/3$. Area = $2\pi rh = \pi(a^2 + h^2) = 2\pi r^2(1 - \cos \theta)$.

Sherman-Morrison formula

$$\left(A + uv^{\mathsf{T}} \right)^{-1} = A^{-1} - \frac{A^{-1}uv^{\mathsf{T}}A^{-1}}{1+v^{\mathsf{T}}A^{-1}u}$$

Kirchhoff's Theorem

Denote L be a $n \times n$ matrix as the Laplacian matrix of graph G, where $L_{ii} =$ d(i), $L_{ij} = -c$ where c is the number of edge (i, j) in G.

- The number of undirected spanning in G is $\det(\tilde{L}_{11})$.
- The number of directed spanning tree rooted at r in G is $\det(\tilde{L}_{rr})$.

BEST Theorem

 $\#\{\text{Eulerian circuits}\} = \#\{\text{arborescences rooted at 1}\} \cdot \prod_{v \in V} (\deg(v) - 1)!$

Random Walk on Graph

Let P be the transition matrix of a strongly connected directed graph, $\sum_{i} P_{i,j} = 1$. Let $F_{i,j}$ be the expected time to reach j from i. Let g_i be the expected time from i to i, $G = \operatorname{diag}(g)$ and J be a matrix all of 1, i.e. $J_{i,j} = 1$. Then, F = J - G + PF

First solve G: let $\pi P = \pi$ be a stationary distribution. Then $\pi_i g_i = 1$. The rank of I-P is n-1, so we first solve a special solution X such that (I-P)X=J-G and adjust X to F by $F_{i,j}=X_{i,j}-X_{j,j}$.

Tutte Matrix

For i < j, $d_{ij} = x_{ij}$ (in practice, a random number) if $(i,j) \in \mathit{E}$, otherwise $d_{ij}=0$. For $i\geq j, d_{ij}=-d_{ji}$. $\frac{\operatorname{rank}(D)}{2}$ is the maximum matching.

Cayley's Formula

- · Given a degree sequence d_1, d_2, \ldots, d_n for each labeled vertices, there're $\frac{(n-2)!}{-1)!(d_2-1)!\cdots(d_n-1)!}$ spanning trees.
- Let $T_{n,k}$ be the number of labeled forests on n vertices with k components, such that vertex $1,2,\ldots,k$ belong to different components. Then $T_{n,k}=$ kn^{n-k-1}

Erdős-Gallai theorem

A sequence of non-negative integers $d_1 \geq d_2 \geq \ldots \geq d_n$ can be represented as the degree sequence of a finite simple graph on n vertices if and only if $d_1+d_2+\ldots+d_n$ is even and $\sum_{i=1}^k d_i \leq k(k-1)+\sum_{i=k+1}^n \min(d_i,k)$ holds for all $1 \le k \le n$.

Havel-Hakimi algorithm

Find the vertex who has greatest degree unused, connect it with other greatest vertex

Gale-Ryser theorem

bigraphic if and only if $\sum_{i=1}^n a_i = \sum_{i=1}^n b_i$ and $\sum_{i=1}^k a_i \leq \sum_{i=1}^n \min(b_i,k)$ holds for every $1 \leq k \leq n$.

Fulkerson-Chen-Anstee theorem

A sequence $(a_1,b_1),\ldots,(a_n,b_n)$ of nonnegative integer pairs with $a_1\geq$ $\cdots \geq a_n$ is digraphic if and only if $\sum_{i=1}^n a_i = \sum_{i=1}^n b_i$ and $\sum_{i=1}^k a_i \leq a_i$ $\sum_{i=1}^k \min(b_i, k-1) + \sum_{i=k+1}^n \min(b_i, k) \text{ holds for every } 1 \leq k \leq n.$ **Euler's planar graph formula** $V - E + F = C + 1. \ E \leq 3V - 6 \text{ (when } V \geq 3)$

Pick's theorem

For simple polygon, when points are all integer, we have ${\cal A}$ #{lattice points in the interior} $+\frac{1}{2}$ #{lattice points on the boundary} -1

Matroid

- $B\subseteq A\wedge A\in \mathcal{I}\Rightarrow B\in \mathcal{I}.$ If $A,B\in \mathcal{I}$ and |A|>|B|, then $\exists x\in A\setminus B, B\cup \{x\}\in \mathcal{I}.$

Linear matroid $A \in I$ iff linear indep. Graphic matroid I = forests of undirected graph Each color c has an upper bound R_c . $A \in I$ iff \exists matching M whose right part is A. Colorful matroid (EX) Transversal matroid Bond matroid $A \in I$ iff G is connected after removing edges A. $A \in I^*$ iff there is a basis $\subseteq E \setminus A$ $A \in I'$ iff $A \in I \land |A| \le k$ Dual matroid

Truncated matroid

Matroid Intersection

Given matroids $M_1=(G,I_1), M_2=(G,I_2)$, find maximum $S\in I_1\cap I_2$. For each iteration, build the directed graph and find a shortest path from s to t.

• $s \to x : S \sqcup \{x\} \in I_1$

 $x \to t : S \sqcup \{x\} \in I_2$

• $y \to x : S \setminus \{y\} \sqcup \{x\} \in I_1$ (y is in the unique circuit of $S \sqcup \{x\}$) • $x \to y : S \setminus \{y\} \sqcup \{x\} \in I_2$ (y is in the unique circuit of $S \sqcup \{x\}$)

Alternate the path, and |S| will increase by 1. In each iteration, |E| = O(RN), where $R=\min(\mathrm{rank}(I_1),\mathrm{rank}(I_2)), N=|G|$. For weighted case, assign weight -w(x) and w(x) to $x\in S$ and $x\notin S$, resp. Find the shortest path by Bellman-Ford. The maximum iteration of Bellman-Ford is 2R+1.

Dual of LP

Primal	Dual
Maximize $c^{T}x$ s.t. $Ax \leq b$, $x \geq 0$	Minimize $b^{T}y$ s.t. $A^{T}y \geq c$, $y \geq 0$
Maximize $c^{T}x$ s.t. $Ax \leq b$	Minimize $b^{T}y$ s.t. $A^{T}y = c, y \geq 0$
Maximize $c^{T}x$ s.t. $Ax = b, x \geq 0$	Minimize $b^{T}y$ s.t. $A^{T}y > c$

Dual of Min Cost b-Flow

- Capacity c_{uv} , Flow f_{uv} , Cost w_{uv} , Required Flow difference for vertex b_u . If all w_{uv} are integers, then optimal solution can happen when all p_u are

$$\begin{split} &\min \sum_{uv} w_{uv} f_{uv} \text{ s.t. } -f_{uv} \geq -c_{uv}, \sum_{v} f_{vu} - \sum_{v} f_{uv} = -b_u \\ \Leftrightarrow &\min \sum_{u} b_u p_u + \sum_{uv} c_{uv} \max(0, p_v - p_u - w_{uv}) \text{ s.t. } p_u \geq 0 \end{split}$$

Minimax Theorem

Let $f: X \times Y \to \mathbb{R}$ be continuous where $X \subset \mathbb{R}^n, Y \subset \mathbb{R}^m$ are compact and convex. If $f(\cdot,y):X\to\mathbb{R}$ is concave for fixed y, and $f(x,\cdot):Y\to\mathbb{R}$ is convex
